

Agenda

Mongo DB

- ① Intro to Mongo DB
- ② Data Storage
- ③ Connection to Mongo Atlas
- ④ Intro to Mongoose (ODM)
 - Entity.
 - Schema
 - Model
- ⑤ CRUD operation with DB

Database

- Store
- Update
- retrieval. (search, index)
- (*) Validation.

(*) SQL	NO SQL
(relational DB)	(non-relational DB)
(*) Structural data	No-Structure
(*) data integrity	Scalability & Flexibility
(*) transaction secure	Schema - on read options.
(*) (ACID)	
(*) row-column oriented	(document, key-value, graph...)

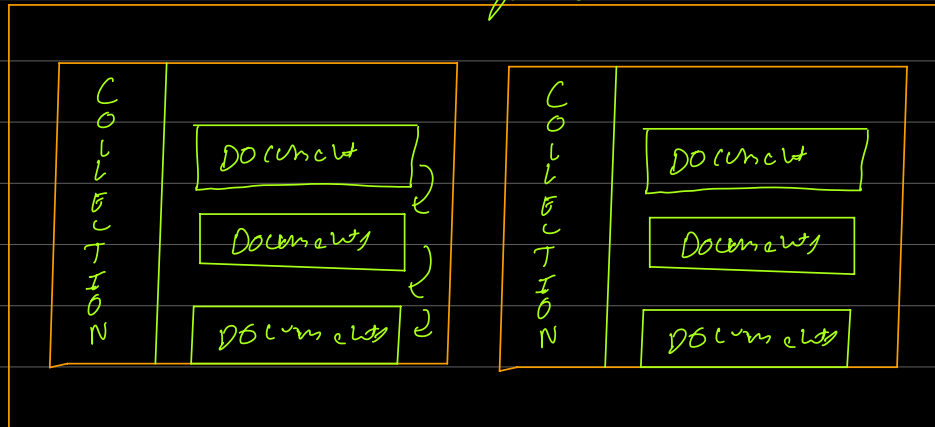

Non-relational DB

- ① Document DB : MongoDB
- ② key-value store : Redis, DynamoDB
- ③ wide-column stores : Cassandra, Google Bigtable, cosmoDB
- ④ graph DB : Neo4j

Mongo DB

- Document (json)
- Format (BSON) : Binary JSON.

Mongo DB.

Collection : products.

Document : Product Information.

{

 _id : ObjectId ("61a6c5529...-79")

 "name" : "Smart phone"

 "brand" : "Ogineesh"

 "price" : { amount : 9999

 currency : "USD"

 "Spec" : {

 "display" : "6.5 inches"

 "Storage" : "256 gb"

 "camera" : "quad-..."

}

]

→ 256.87

→ USD / EUR / GBP
- - - - -

Entity, Schema, model

① Entity: (E-commerce)

- product
- user
- seller
- reviews
- payment
- category
- order.
- ⋮

② Schema

: A Schema in MongoDB defines the structure of the data for an entity.

(both schemas are not equal)

① Model:

→ It is an instance of a schema and represent collection of document in the DB that adhere to the schema structure.

→
